

The zero-sway column-removal screen is not always exact: an interval-margin certificate decides when it can be trusted

Question

Is the fast zero-sway screen
the true first-order limit?

Certificate

all interval margins ≥ 0

screen is EXACT

otherwise a sway mechanism
beats it, and the margin
names the story interval

decided in $O(H)$ per removal

Finding

Single bay **0 / 96 exact**

Two bays and up **192 / 192 exact**

Realistic upgrades **0 broke**

Independent LP checks **912**

catalogue sections, $F_y = 345$ MPa
